Agile Backlog Creation & Sprint Simulation in Jira

Gandhar Gokhale PES1UG24CS167 5C

Backlog with Epics, Stories & Story Points

Active Sprint with To Do / In Progress / Done

Burndown Chart

Reflection Questions:

1. Did your estimations reflect the actual effort?

The story point estimates provided a representation of the relative effort required for each task. Smaller tasks such as submitting the inspection verification were estimated at 3 points and the larger tasks such as placing an order with escrow payment and resolving disputes were estimated at 8 points. During the sprint simulation, the estimates were generally consistent with the perceived complexity of tasks.

2. Was the backlog well-prioritized?

Yes. The backlog was prioritized according to the importance of the transaction flow. Product listing and ordering were given high priority, followed by the inspection and the buyer approval, and finally the dispute and escrow resolution. This prioritization ensures that the main marketplace transaction can be established before handling any exception scenarios.

3. How did the simulated sprint align with your original plan?

The simulated sprint generally aligned with the planned workflow. The sprint began with the core product listing and inspection activities. Three stories were completed, two were in progress and remaining two remained in the To Do column. This showed us how the planned requirements could be converted into manageable Agile work items and progressed through using a sprint.

4. What insights did the burndown chart give about team capacity?

The burndown chart showed that the sprint started with 39 story points and that 15 story points had been completed, leaving 26 story points remaining. This shows us that the team was able to complete a portion of the planned work but still had a lot of work remaining. The chart provides us with a visual indication of the team's progress and can be used to assess whether the team is likely to complete the remaining work within the sprint or not.
